

GIS Intake Assistant — Step 1 Summary

Objective

Create a simple internal tool that reduces time spent finding the correct GIS portal for a new project.

Current Workflow Solved

Typical drafter workflow:

```
Receive project address
→ search Google for GIS / parcel viewer
→ identify county/jurisdiction
→ find correct GIS portal
```

Current prototype improves this to:

```
Enter address
→ geocode address
→ detect county + state
→ check known GIS database
→ direct GIS link if known
→ smart fallback search if unknown
```

Current Architecture

```
INPUT
  Address
  City
  State
  Project Type

FLOW
  Geocode address
  → detect county/state
  → check gis_portals.csv

IF MATCH FOUND
  → show saved GIS portal
```

IF NO MATCH

- search web for likely official GIS portals
- show top candidates

IF SEARCH FAILS

- fallback Google GIS search

Current Files

```
GIS_Intake_Assistant/  
├─ app.py  
├─ requirements.txt  
└─ gis_portals.csv
```

Current App Dependencies

```
streamlit  
geopy  
pandas  
ddgs
```

Current MVP Features

✓ Address input ✓ City / state input ✓ Project type input ✓ Address geocoding ✓ County / state detection ✓ Known GIS portal routing ✓ Fallback GIS search ✓ Browser deployment (no installation required for users)

Current Tech Stack

- Python
 - Streamlit
 - Geopy / Nominatim
 - GitHub
 - Streamlit Cloud
-

Current Limitation

The GIS directory is still manual.

Right now:

County + State → GIS URL

must be added by us.

Unknown jurisdictions fall back to search.

MVP Outcome

The tool is publicly deployed and usable as a browser-based prototype.

Primary value:

Reduce GIS lookup friction for drafters while building a reusable jurisdiction GIS database over time.

Current Limitations

- GIS suggestions are not yet guaranteed official
 - search results may vary by engine availability
 - no one-click "save verified GIS" workflow yet
 - no assessor / zoning auto-routing yet
-

Status

Prototype successfully deployed.

Current capability:

Enter an address → get either a saved GIS portal or intelligent GIS suggestions.

Good stopping point for today.

Next likely step:

verified GIS saving workflow / ED database growth
