

GIS Intake Assistant — Step 2 Summary

Purpose

Step 2 turns the GIS Intake Assistant from a simple GIS finder into a small reusable source database for drafting research.

The app now supports this workflow:

```
Enter project address
→ detect county/state
→ show saved official sources if available
→ suggest GIS / zoning sources if missing
→ save verified source back to local database
```

User Journey

Decision gate:

```
Does this project require parcel / site information to begin?
```

```
YES ↓ GIS Intake Assistant
```

```
NO → proceed with normal production workflow
```

Typical use:

1. Drafter receives project address
2. Drafter enters address, city, state
3. App detects county/state
4. App checks saved source database
5. If saved sources exist, drafter opens them
6. If missing, app suggests GIS / zoning sources
7. Drafter verifies correct source
8. Drafter saves verified source into database
9. Future projects in that county reuse saved sources

Current Working Version

Version: v0.1

Current working features:

- ✓ structured address fields
- ✓ county/state detection
- ✓ saved source lookup
- ✓ multiple source types per county
- ✓ parcel/GIS source display
- ✓ zoning map source display
- ✓ zoning source search with stricter place matching
- ✓ save verified source form
- ✓ duplicate URL prevention
- ✓ local search logging
- ✓ session state so results stay visible while using save form

Current Database Files

gis_portals.csv → saved official GIS / zoning / assessor sources
search_log.csv → local lookup activity log

Current `gis_portals.csv` format

```
county,state,source_type,source_name,source_url,notes,last_verified  
mesa county,colorado,parcel_gis,Mesa County GIS Viewer,https://  
emap.mesacounty.us/viewer/,Main parcel GIS source,2026-05-27
```

Allowed `source_type` values:

```
parcel_gis  
zoning_map  
assessor  
zoning_ordinance  
other
```

Important rule:

Only save zoning_map if it is a genuinely different source URL from parcel_gis.

Good zoning examples:

separate zoning web map
zoning PDF map
official zoning ordinance page
city zoning lookup page

Do not save the same parcel GIS viewer again as `zoning_map`.

Current Required Project Files

```
GIS_intake_assistant/  
├─ app.py  
├─ requirements.txt  
├─ gis_portals.csv  
├─ search_log.csv  
└─ versions/
```

Current `requirements.txt`

```
streamlit  
geopy  
pandas  
ddgs
```

Local Run Blocks

Start local app from VS Code terminal

```
cd "C:/Users/isa/Documents/Isa/05_Work/Evolution Drafting/00_Personal Resources/  
Automations/GIS_intake_assistant"  
Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Scope Process  
.venv/Scripts/Activate.ps1  
streamlit run app.py
```

If already inside project folder

```
Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Scope Process  
.venv/Scripts/Activate.ps1  
streamlit run app.py
```

Stop Streamlit

```
Ctrl + C
```

Version Backup Rule

Before changing code, save the current working file:

```
versions/app_v0_2_7.py
```

Next version should be saved as:

```
versions/app_v0_2_8.py
```

Git / Deployment Blocks

Check changed files

```
git status
```

Commit working version

```
git add app.py requirements.txt gis_portals.csv search_log.csv  
git commit -m "Save GIS intake assistant v0.1"  
git push
```

Note: only include `search_log.csv` if we want the local log included in GitHub. For shared deployment later, we may choose not to commit logs.

Deployment Reminder

Streamlit Cloud redeploys from GitHub after push.

Typical deployment path:

```
VS Code
→ GitHub commit/push
→ Streamlit Cloud auto-redeploy
→ test public app link
```

Known Issues / Next Fixes

- Save form still has slight dropdown rerun behavior, but workaround works.
- Saved source is local CSV only for now.
- Streamlit Cloud may not persist CSV edits reliably long-term.
- Need to decide later between Google Sheets, Notion, or another shared database.

Next Logical Build

Possible next step:

```
Move saved source database from local CSV to shared Google Sheet or Notion
database.
```

Reason:

```
Local CSV works for prototype.
Shared database is needed for real team use.
```
